MapReduce基础算法程序设计 (II)

摘要

- MapReduce单词同现分析算法
- MapReduce文档倒排索引算法
- MapReduce专利文献数据分析

构建单词同现矩阵算法

- Word Co-occurrence Matrix
  - 语料库的单词同现矩阵是一个二维 N×N矩阵
  - N是语料库的词汇量（即，不同单词的数目）
  - 矩阵元素M[i, j] 代表单词W[i] 与单词W [j]在一定范围内同现的次数（一个语句中，一个段落中，一篇文档中，或文本串中一个宽度为M个单词的窗口中，这些都依具体问题而定）
- Building word co-occurrence matrices from large corpora
  - a common task in text processing, and provides the starting point to many other algorithms.

构建单词同现矩阵算法

A Word Co-occurrence Matrix Example

	agent	mining	communication	audio	cognition	...
Mitsuru Ishizuka	454	143	414	382	246	...
Koiti Hasida	412	156	1020	458	1150	...
Yutaka Matsuo	129	112	138	89	58	...
Nobuaki Minematsu	227	22	265	648	138	...
Yohei Asada	6	6	6	2	0	...
...	...	...	...	...	...	...

Figure: Example of person-to-word co-occurrence matrix

Figure taken from: Yutaka Matsuo, …, POLYPHONET: An Advanced Social Network Extraction System from the Web, 2006

构建单词同现矩阵算法

- Building the words co-occurrence matrix
  - 如果内存足够大，把整个矩阵放在内存中，矩阵元素的计算会非常简单
  - 实际上，web-scale的文档的词汇量可能有数十万，甚至数亿
  - 同现矩阵的空间开销为 $O(n^2)$
  - 简单地在单机上的实现，内存与磁盘之间的换页会使任务的执行十分缓慢

构建单词同现矩阵算法

M.R. Algorithm (“pairs” approach) pseudo-code:

```
1: class Mapper
2:   method Map(docid a, doc d)
3:     for all term w ∈ doc d do
4:           for all term u ∈ Neighbors(w) do
5:               //Emit  count  for each co-occurrence
                 Emit(pair (w, u), count 1)
```

```
1: class Reducer
2:  method Reduce(pair p; counts [c1, c2,…])
3:     s ← 0
4:        for all count c 2 counts [c1, c2,…] do
5:            s ← s + c          //Sum co-occurrence counts
6:        Emit(pair p, count s)
```

构建单词同现矩阵算法

- A simple “pairs” approach example
  - 语料

    we are not what we want to be but at least we are not what we used to be
  - 同现定义 Neighbors (w)
    - words that co-occur with w within a 2-word window

构建单词同现矩阵算法

A simple “Pairs” approach example (cont.)

- after map
  - (<we, are>, 1)
  - (<are, not>, 1)
  - (<not, what>, 1)
  - (<we, want>, 1)
  - (<want, to>, 1)
  - (<to, be>, 1)
  - (<but, at>,1)
  - (<at, least>,1)
  - (<we, are>,1)
  - (<are, not>,1)
  - (<not, what>,1)
  - (<we , used>,1)
  - (<used, to>,1)
  - (<to, be>,1)

构建单词同现矩阵算法

- A simple “Pairs” approach example (cont.)
  - after shuffle and sort
    - (<we, are>,[1,1])
    - (<are, not>,[1,1])
    - (<not, what>,[1,1])
    - (<we, want>,[1])
    - (<want, to>,[1])
    - (<to, be>,[1,1])
    - (<but, at>, [1])
    - (<at, least>, [1])
    - (<we, used>, [1])
    - (<used, to>, [1])

构建单词同现矩阵算法

- A simple “Pairs” approach example (cont.)
  - after reduce
    - (<we, are>,2)
    - (<are, not>,2)
    - (<not, what>,2)
    - (<we, want>,1)
    - (<want, to>,1)
    - (<to, be>,2)
    - (<but, at>,1)
    - (<at, least>,1)
    - (<we, used>,1)
    - (<used, to>,1)

构建单词同现矩阵算法

- A simple “Pairs” approach example (cont.)

	we	are	not	what	want	to	be	but	at	least	used
we		2			1						1
are	2		2								
not		2		2							
what			2								
want	1					1					
to					1		1				1
be						1					
but									1		
at								1			
least											
used	1					1					

Figure: the co-occurrence matrix

构建单词同现矩阵算法

- 算法的扩展
  - 同现定义 Neighbors(w)为其他形式时该怎么实现
    - 根据同现关系的不同，可能需要实现和定制不同的FileInputFormat和RecordReader，
    - 如同现关系为一个英文句子，则需要实现以一个英文句子为单位的FileInputFormat和RecordReader
    - 如同现关系为一个段落，则需要实现以一个段落为单位的FileInputFormat和RecordReader
  - 同现关系可扩展为从大量观察数据中进行任意离散关联事件的分析和数据挖掘
  - 类似应用问题
    - 零售商通过分析大量的交易记录，识别出关联的商品购买行为（如：“啤酒和纸尿裤”的故事）
    - 从生物医学文献中自动挖掘基因交互作用关系

文档倒排索引算法

- 文档倒排算法简介
  - Inverted Index(倒排索引)是目前几乎所有支持全文检索的搜索引擎都要依赖的一个数据结构。基于索引结构，给出一个词(**term**)，能取得含有这个term的文档列表(the list of **documents**)
  - Web Search中的问题主要分为三部分：
    - crawling(gathering web content)
    - indexing(construction of the inverted index)
    - retrieval(ranking documents given a query)
  - crawling和indexing都是离线的，retrieval是在线、实时的

文档倒排索引算法

- 简单的文档倒排算法

doc1：
one fish
two fish

doc2：
red fish
blue fish

doc3：
one red bird

倒排索引：
one: doc1, doc3
fish: doc1, doc2
two: doc1
red: doc2, doc3
blue: doc2
bird: doc3

基于以上索引的搜索结果：

fish → doc1, doc2
red → doc2, doc3
red fish → doc2

文档倒排索引算法

- 简单的文档倒排算法

改进：map输出的key除了文件名,还给出了该词所在行的偏移值：
格式：filename#offset

```
import java.io.IOException;
import java.util.StringTokenizer;
import org.apache.hadoop.io.Text;
import org.apache.hadoop.mapreduce.Mapper;
public class InvertedIndexMapper extends Mapper<Text, Text, Text, Text> {
    @Override
     protected void map(Text key, Text value, Context context)  throws IOException, InterruptedException {
            // default RecordReader: LineRecordReader; key: line offset; value: line string
            FileSplit fileSplit = (FileSplit)context.getInputSplit();
            String fileName = fileSplit.getPath().getName();
            Text word = new Text();
            Text fileName_lineOffset = new Text(fileName+"#"+key.toString());
            StringTokenizer itr = new StringTokenizer(value.toString());
            for(; itr.hasMoreTokens(); ) {
                    word.set(itr.nextToken());
                    context.write(word, fileName_lineOffset);
            }
    }
}
```

文档倒排索引算法

简单的文档倒排算法

```
import java.io.IOException;
import java.util.Collections;
import java.util.Iterator;
import org.apache.hadoop.io.Text;
import org.apache.hadoop.mapreduce.Reducer;

public class InvertedIndexReducer extends Reducer<Text, Text, Text, Text> {
    @Override
    protected void reduce(Text key, Iterable<Text> values, Context context) throws IOException, InterruptedException {
                    Iterator<Text> it = values.iterator();
                    StringBuilder all = new StringBuilder();
                    if(it.hasNext())  all.append(it.next().toString());
                    for(; it.hasNext(); ) {
                              all.append(“;");
                              all.append(it.next().toString());
                     }
                    context.write(key, new Text(all.toString()));
     } //最终输出键值对示例：(“fish", “doc1#0; doc1#8;doc2#0;doc2#8 ")
}
```

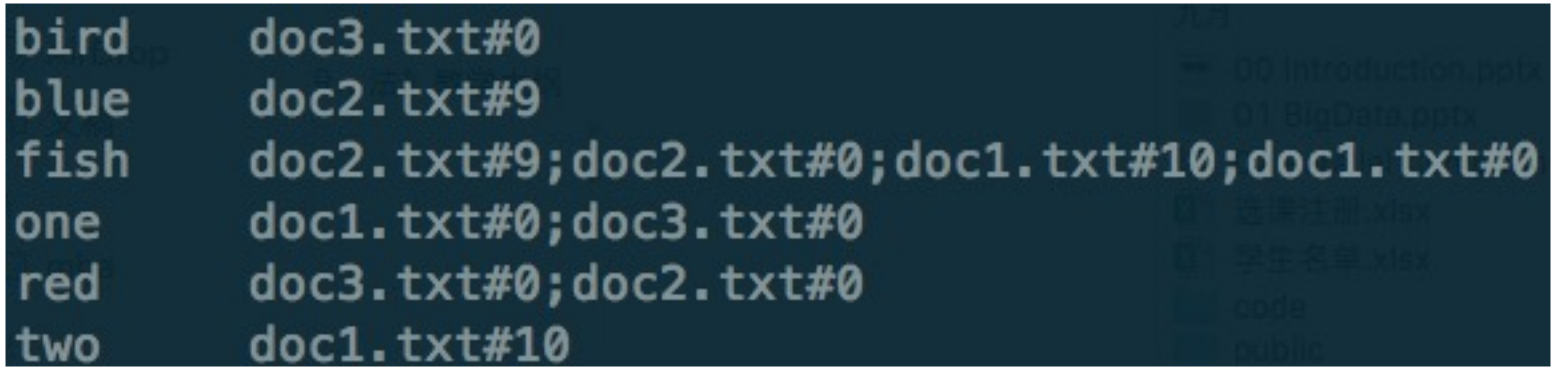
文档倒排索引算法

- 简单的文档倒排算法

```
public class InvertedIndexer{
    public static void main(String[] args) {
        try {
                Configuration conf = new Configuration();
                job = new Job(conf, "invert index");
                job.setJarByClass(InvertedIndexer.class);
                job.setInputFormatClass(TextInputFormat.class);
                job.setMapperClass(InvertedIndexMapper.class);
                job.setReducerClass(InvertedIndexReducer.class);
                job.setOutputKeyClass(Text.class);
                job.setOutputValueClass(Text.class);
                FileInputFormat.addInputPath(job, new Path(args[0]));
                FileOutputFormat.setOutputPath(job, new Path(args[1]));
                System.exit(job.waitForCompletion(true) ? 0 : 1);
            } catch (Exception e) {   e.printStackTrace(); }
    }
}
```

文档倒排索引算法

- 输出



```
bird    doc3.txt#0
blue    doc2.txt#9
fish    doc2.txt#9;doc2.txt#0;doc1.txt#10;doc1.txt#0
one     doc1.txt#0;doc3.txt#0
red     doc3.txt#0;doc2.txt#0
two     doc1.txt#10
```

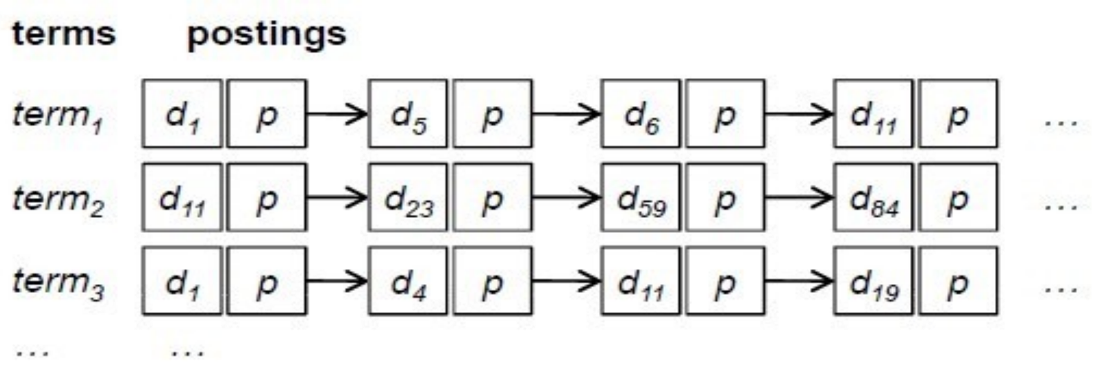
文档倒排索引算法

- 带词频等属性的文档倒排算法
  - 如果考虑单词在每个文档中出现的词频、位置、对应Web文档的URL等诸多属性，则前述简单的倒排算法就不足以有效工作。我们把这些词频、位置等诸多属性称为有效负载（Payload）

注：以下的算法内容引自Jimmy Lin，Data-Intensive Text Processing with MapReduce， 2010，College Park, 以及其课件

文档倒排索引算法

- 带词频等属性的文档倒排算法
  - 基本的倒排索引结构



terms
postings
term1
term2
term3
d1 p → d5 p → d6 p → d11 p …
d11 p → d23 p → d59 p → d84 p …
d1 p → d4 p → d11 p → d19 p …
… …

- 一个倒排索引由大量的postings list构成
- 一个postings list由多个posting构成(按doc id排序)
- 一个postings list与一个term关联
- 一个posting 包含一个document id和一个payload
- payload上载有term在document中出现情况相关的信息(e.g. term frequency, positions, term properties)
- 同时还有对应Web文档到其URL的映射doc_id→URL

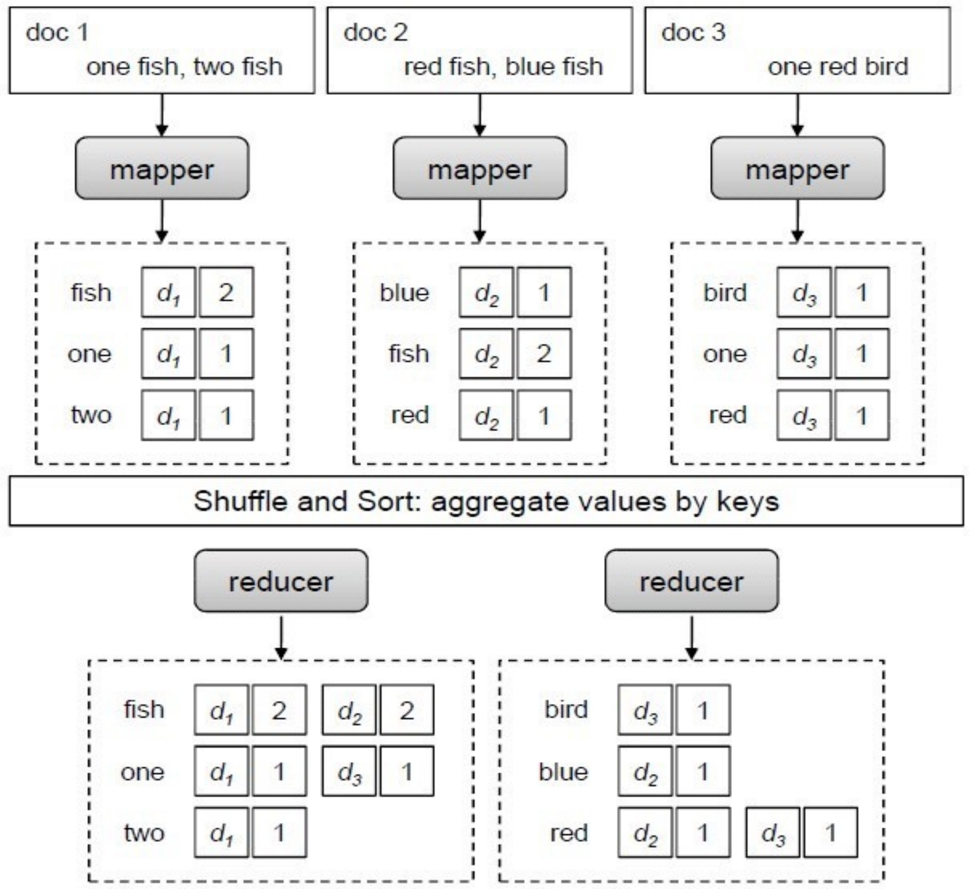
文档倒排索引算法

- 带词频等属性的文档倒排算法
  - Map和Reduce实现伪代码

```
1: class Mapper
2:     procedure Map(docid dn, doc d)
3:         F ← new AssociativeArray
4:         for all term t ∈ doc d do
5:             F{t} ← F{t} + 1
6:         for all term t ∈ F do
7:             Emit(term t, posting <dn, F{t}>)
-----------------------------------------------------------------
1: class Reducer
2:     procedure Reduce(term t, postings [<dn1, f1>, <dn2, f2>…])
3:         P ← new List
4:         for all posting <dn, f> ∈ postings [<dn1, f1>, <dn2, f2>…] do
5:             Append(P, <dn, f>)
6:         Sort(P)
7:         Emit(term t; postings P)
```

文档倒排索引算法

- 带词频等属性的文档倒排算法



A simple example posting(docid, tf)

文档倒排索引算法

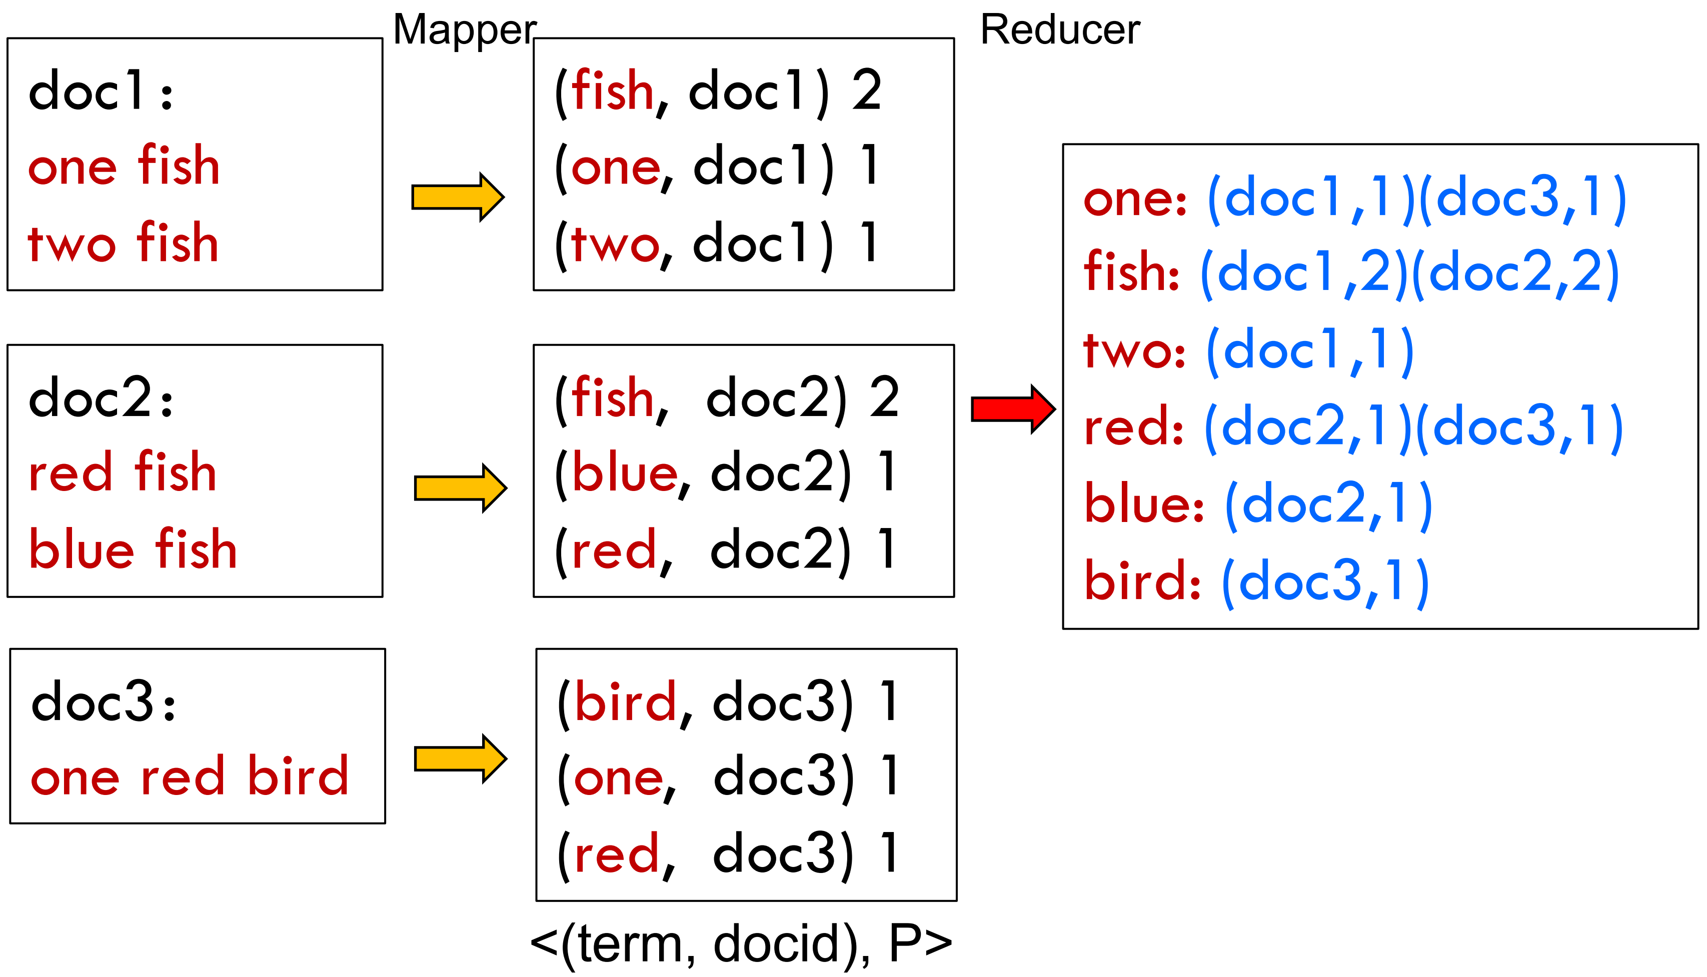
- 带词频等属性的文档倒排算法
  - Scalability bottleneck
    - The algorithm assumes that there is sufficient memory to hold all postings associated with the same term.
    - The reducer first buffers all postings and then performs an in-memory sort.
    - As collections grow larger, reducers will run out of memory.
  - Solution
    - let the MapReduce runtime do the sorting
    - Emit the intermediate key-value pairs like this:

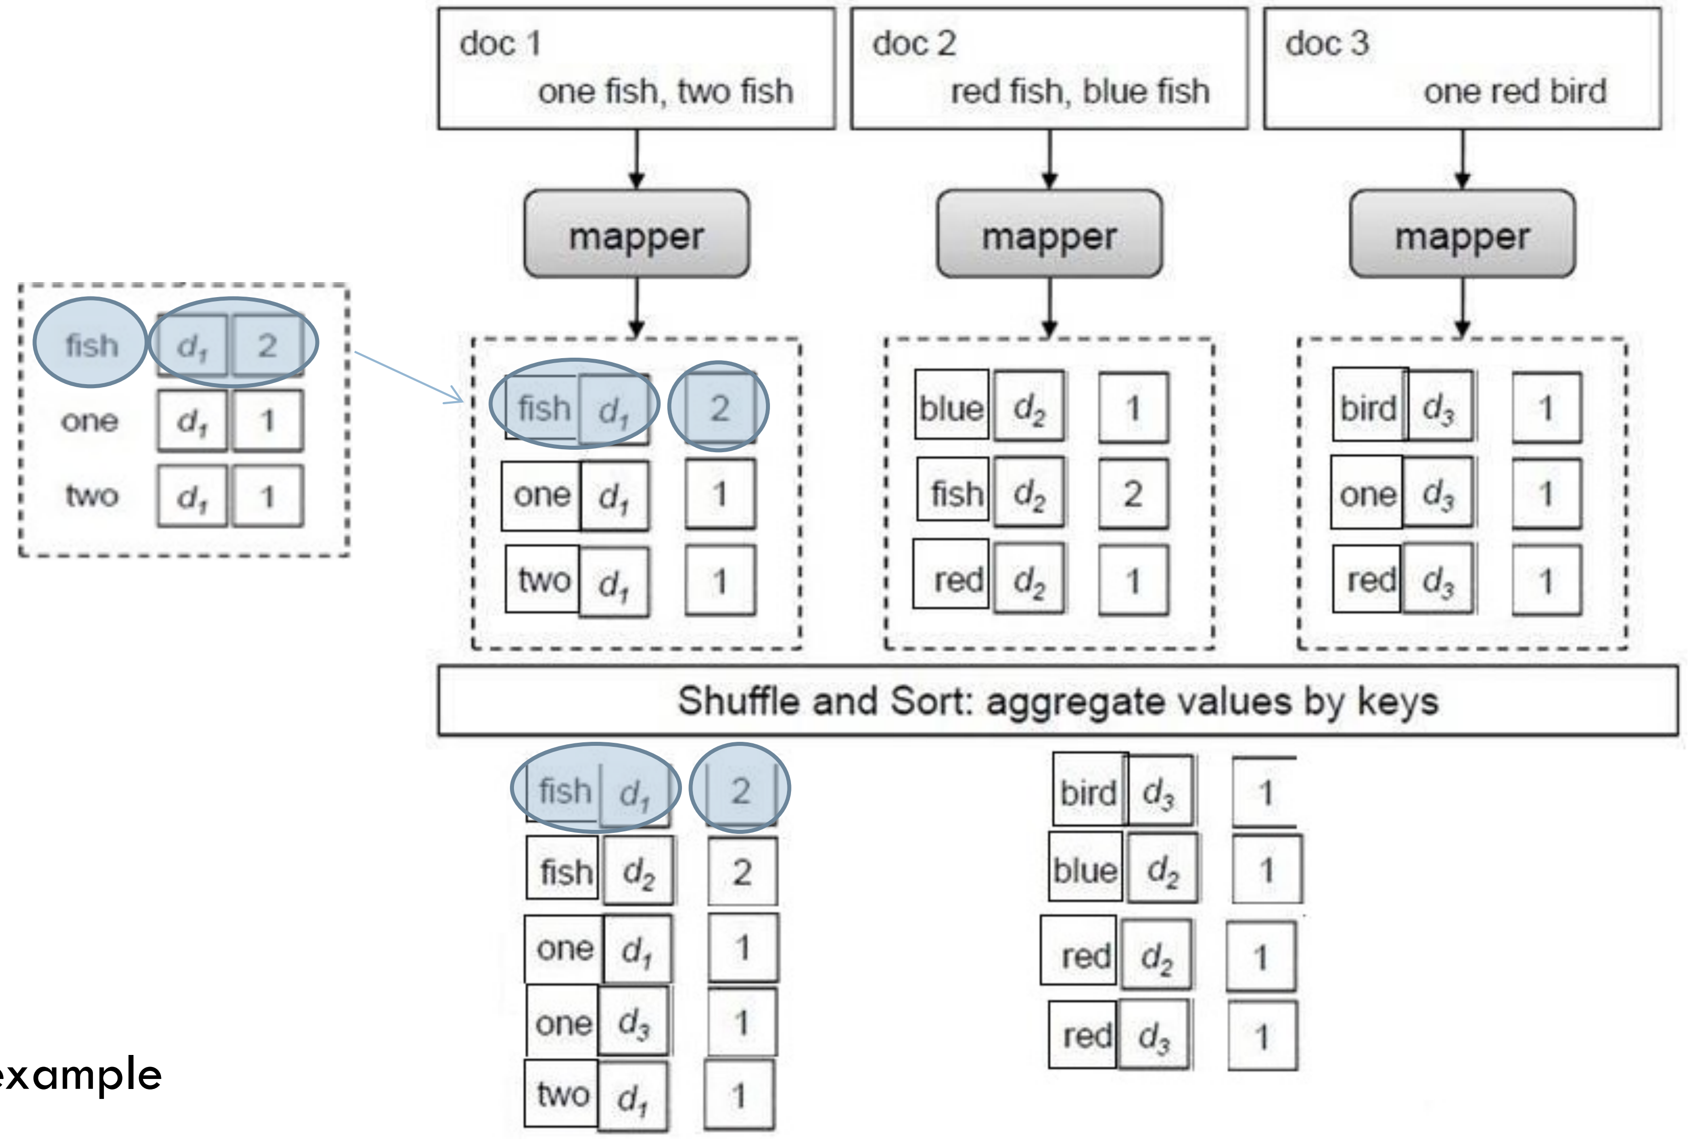
      (tuple <term, docid>, tf f)

      (design trick: value-to-key conversion)

文档倒排索引算法

- 带词频属性的文档倒排算法





A revised example

文档倒排索引算法

- 可扩展的带词频属性的文档倒排算法
  - **Mapper**

```
1: class Mapper
2:     method Map(docid dn; doc d)
3:         F ← new AssociativeArray
4:         for all term t ∈ doc d do
5:             F{t} ← F{t} + 1
6:         for all term t ∈ F do
7:             Emit(tuple<t, dn>, tf F{t})
```

文档倒排索引算法

- 可扩展的带词频属性的文档倒排算法
  - A customized partitioner
    - Why?
      - To ensure that all tuples with the same term are shuffled to the same reducer(notice that the new key is a <term, docid> tuple)

问题：当对键值对进行shuffle处理以传送给合适的Reducer时，将按照新的键<t,dn> 进行排序和选择Reducer，因而同一个term的键值对可能被分区到不同的Reducer!

解决方案：定制Partitioner来解决这个问题

文档倒排索引算法

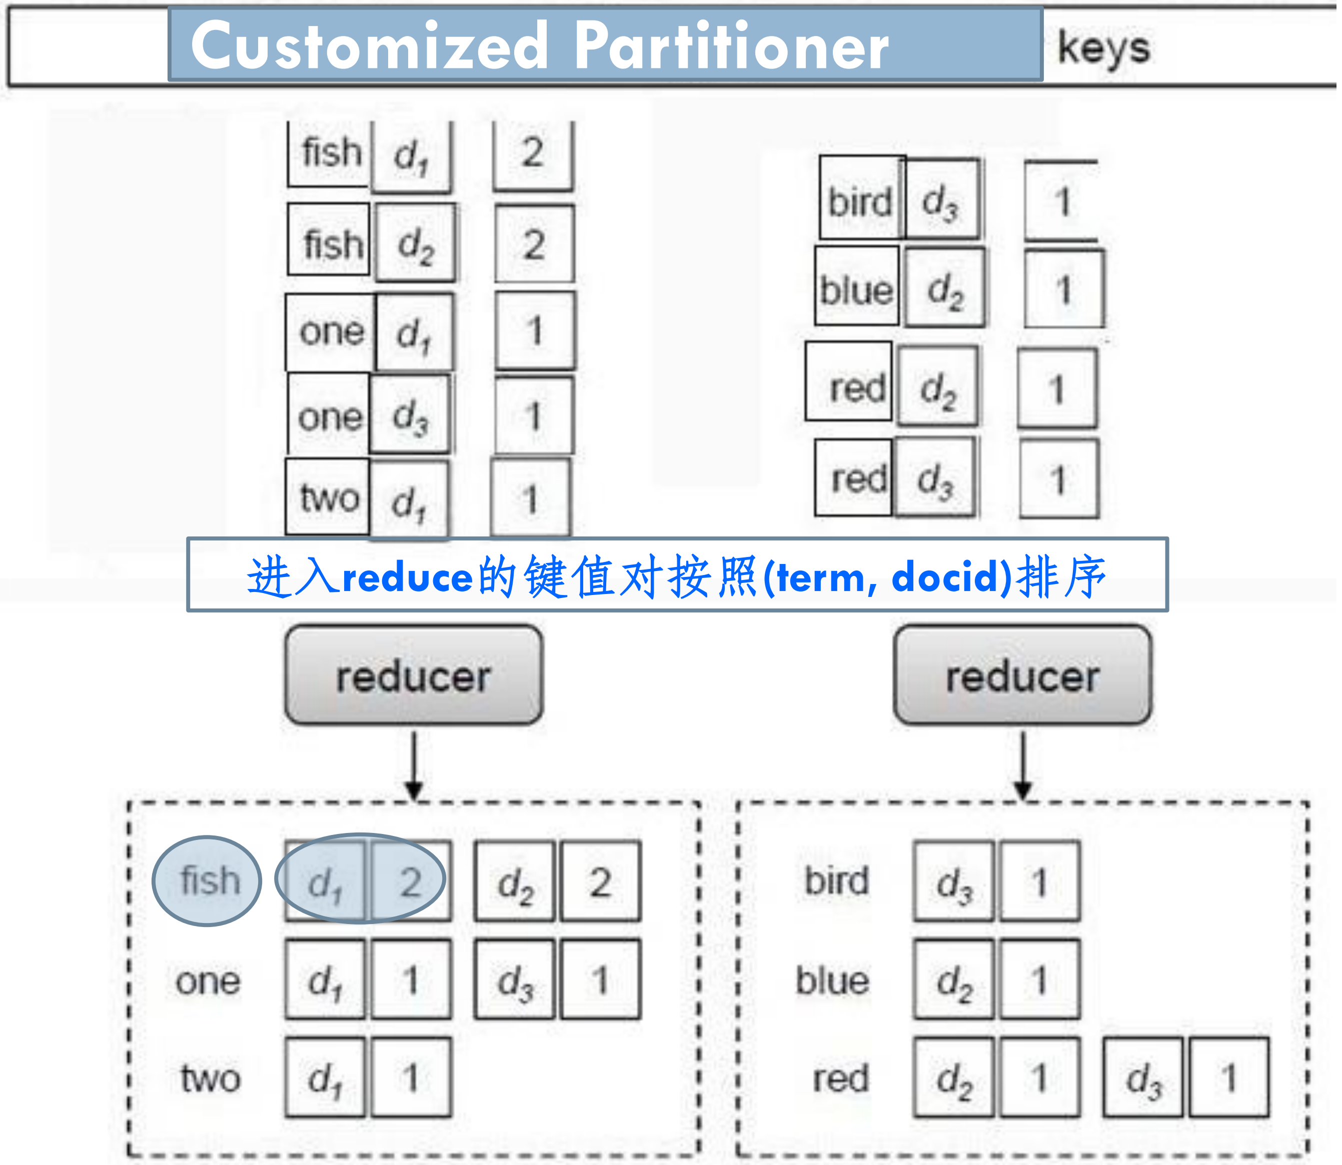
- 可扩展的带词频属性的文档倒排算法
  - **How?**
    - 基本思想是把组合键<term, docid> 临时拆开，“蒙骗”partitioner按照<term>而不是<term, docid>进行分区选择正确的Reducer，这样可保证同一个term下的一组键值对一定被分区到同一个Reducer。
    - Class **NewPartitioner** extends HashPartitioner<K,V> {

```
      // org.apache.hadoop.mapreduce.lib.partition.HashPartitioner
      // override the method
      getPartition(K key, V value, int numReduceTasks) {
          term = key. toString().split(“,”)[0];    //<term, docid>=>term
          super.getPartition(term, value, numReduceTasks); } }
```

    - Set the customized partitioner in job configuration

      Job.setPartitionerClass(NewPartitioner)

Customized Partitioner



A revised example(cont.)

文档倒排索引算法

- 可扩展的带词频属性的文档倒排算法
  - **Reducer**

```
1: class Reducer
2:     method Setup // 初始化
3:         $t_{prev} \leftarrow \varnothing$;
4:         $P \leftarrow$ new PostingsList
5:     method Reduce(tuple <t, n>, tf [f])
6:         if $t \neq t_{prev} \wedge t_{prev} \neq \varnothing$ then
7:             Emit($t_{prev}$, $P$)
8:             $P$.Reset()
9:         $P$.Add(<n, f>)
10:        $t_{prev} \leftarrow t$
11:    method Cleanup
12:        Emit(t, $P$)
```

用于输出最后一次未得到输出的<t, P>

文档倒排索引算法

- 可扩展的带词频属性的文档倒排算法
  - Extensions
    - 单词形态还原(e.g. ‘books’ -> ‘book’, …)
    - removing stop-words (common words such as ‘the’, ‘a’, ‘of’, etc.)

专利文献数据分析

数据源：美国专利文献数据

- Available from the National Bureau of Economic Research at http://www.nber.org/patents/
- The data sets were originally compiled for the paper “The NBER Patent Citation Data File: Lessons, Insights and Methodological Tools.”
- Two data sets：
  - Citation data set “cite75_99.txt”
  - Patent description data set “apat63_99.txt”

专利文献数据分析

数据源：美国专利文献数据

Citation data set “cite75_99.txt”

```
“CITING”,”CITED”
3858241,956203
3858241,1324234

专利文献数据分析

数据源：美国专利文献数据

Patent description data set “apat63_99.txt”

Attribute name	Content
PATENT	Patent number
GYEAR	Grant year
GDATE	Grant date, given as the number of days elapsed since January 1, 1960
APPYEAR	Application year (available only for patents granted since 1967)
COUNTRY	Country of first inventor
POSTATE	State of first inventory (if country is U.S.)
ASSIGNEE	Numeric identifier for assignee (i.e., patent owner)
ASSCODE	One-digit (1-9) assignee type. (The assignee type includes U.S. individual U.S. government, U.S. organization, non-U.S. individual, etc.)
CLAIMS	Number of claims (available only for patents granted since 1975)
NCLASS	3-digit main patent class

专利文献数据分析

- 专利被引列表(citation data set 倒排)
- Map

```
public static class MapClass extends Mapper<LongWritable, Text, Text, Text> {
    public void map(LongWritable key, Text value, Context context) throws IOException, InterruptedException {
    // 输入key: 行偏移值；  value: “citing专利号, cited专利号” 数据对
        String[] citation = value.toString().split(“,”);
        context.write(new Text(citation[1]), new Text(citation[0]));
    } // 输出key: cited 专利号；  value: citing专利号
}
```

专利文献数据分析

- 专利被引列表(citation data set 倒排)
- Reduce

```
public static class ReduceClass extends Reducer<Text, Text, Text, Text> {
    public void reduce(Text key, Iterable<Text> values, Context context) throws IOException, InterruptedException
    {
        String csv = “”;
        for (Text val:values) {
            if (csv.length() > 0) csv += “,”;
            csv += val.toString();
        }
        context.write(key, new Text(csv));
    } // 输出key: cited专利号； value: “citing专利号1, cited专利号2,…”
}
```

- Reduce Class

```
public static class ReduceClass extends Reducer< IntWritable,IntWritable,IntWritable,IntWritable > {
    public void reduce(IntWritable key, Iterable<IntWritable> values,           Context context)
                          throws IOException, InterruptedException {
        int count = 0;
        while (values.hasNext()) {
                count += values.next().get();
            }
        context.write(key, new IntWritable(count));
     } // 输出key: 被引次数;  value: 总出现次数
}
```

专利文献数据分析

主类-- CitationHistogram

```
public class CitationHistogram{
    public static void main(String[] args) {
        Configuration conf = new Configuration();
        JobConf job = new JobConf(conf, CitationHistogram.class);
        Path in = new Path(args[0]);
        Path out = new Path(args[1]);
        FileInputFormat.setInputPaths(job, in);
        FileOutputFormat.setOutputPath(job, out);
        job.setJobName("CitationHistogram");
        job.setMapperClass(MapClass.class);
        job.setReducerClass(ReduceClass.class);
        job.setInputFormat(KeyValueTextInputFormat.class);
        job.setOutputFormat(TextOutputFormat.class);
        job.setOutputKeyClass(IntWritable.class);
        job.setOutputValueClass(IntWritable.class);
        System.exit(job.waitForCompletion(true) ? 0 : 1);
    }
}
```

……
```

主要设计思想是：分析以上的专利描述数据集，根据要统计的列名(年份或国家等)，取出对应列上的年份(col_idx=1)或国家(col_idx=4)，然后由Map发出(year，1)或(country，1)，再由Reduce累加。

专利文献数据分析

- 年份/国家专利数统计
- Map Class

```
public static class MapClass extends Mapper<Text, Text, Text, LongWritable> {
    private final static IntWritable one = new IntWritable(1);
    private int col_idx = 1;  // 1: 年份;   4: 国家
    public void map(Text key,  Text value, Context context)
                throws IOException, InterruptedException {
            String[] cols = value.Split(‘,’);  // value: 读入的一行专利描述数据记录
        String col_data = cols[col_idx];
            context.write (new Text(col_data), one);
    }
}
```

年份或国家

出现1次

专利文献数据分析

- 年份/国家专利数统计
- Reduce Class

```
public static class ReduceClass extends Reducer< Text, IntWritable, Text, IntWritable > {
    public void reduce(Text key, Iterable<IntWritable> values, Context context) throws IOException,
    InterruptedException {
        int count = 0;
        while (values.hasNext()) {    count += values.next().get(); }
        context.write(key, new IntWritable(count));
    } // 输出key: 年份或国家； value: 总的专利数
}
```

专利文献数据分析

- 年份专利统计输出

“GYEAR” 1

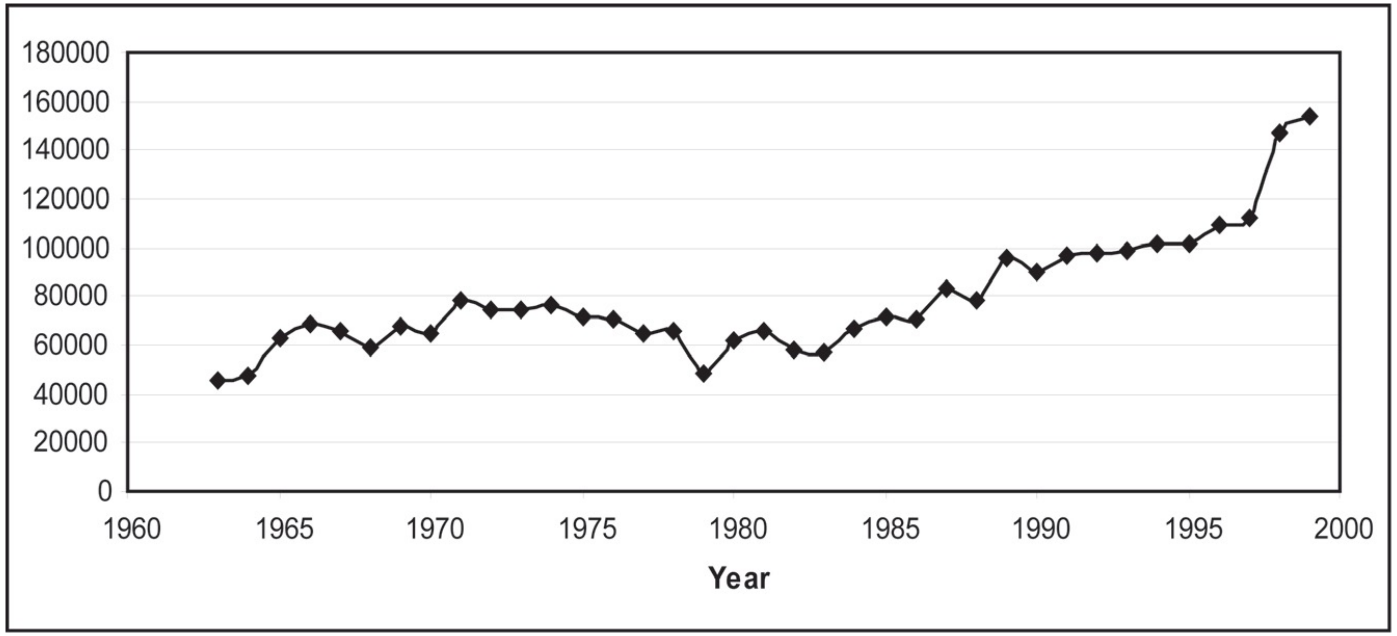
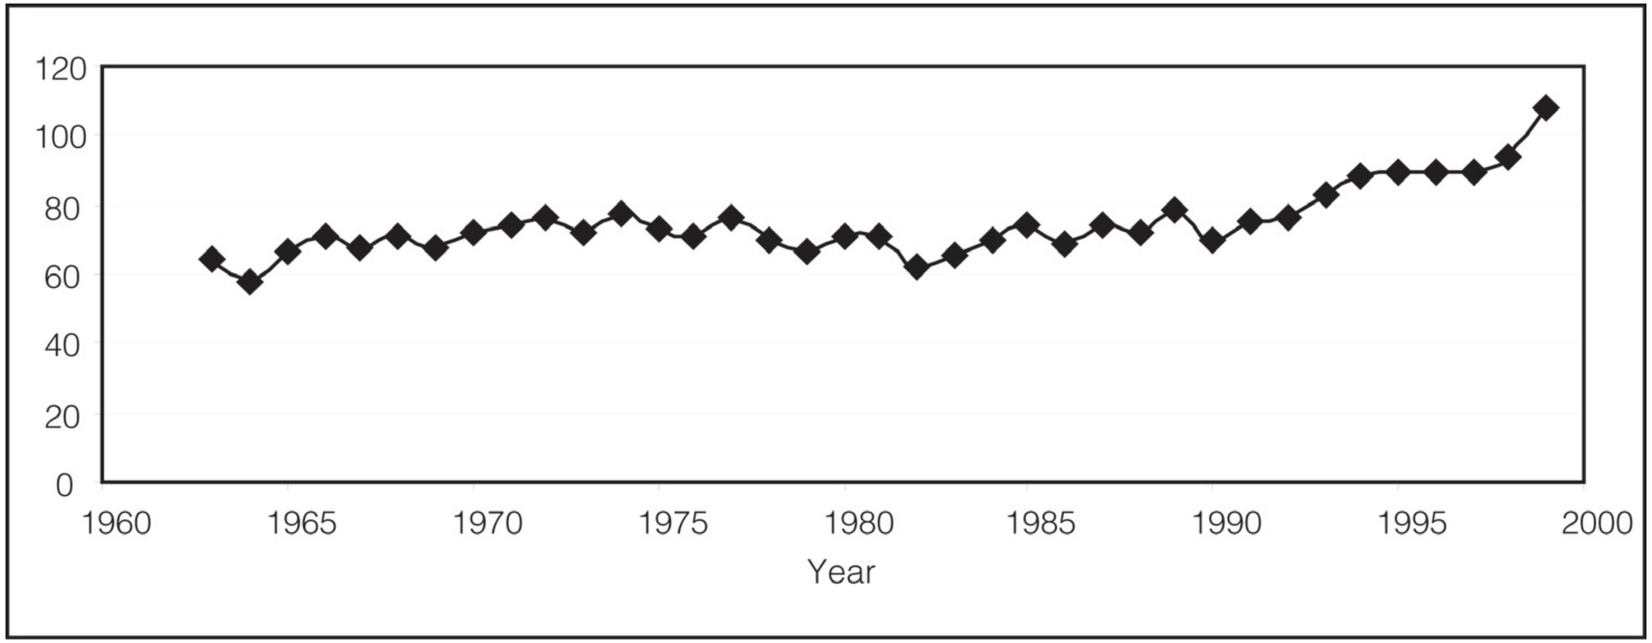
1964	47375
1965	62857
…	
1996	109645
1997	111983
1998	147519
1999	153486



专利文献数据分析

- 每年申请美国专利的国家数统计
  - 假如我们需要从专利描述数据集中统计每年有多少个国家申请了美国专利，并得出如下的统计图，该如何实现Map和Reduce?



专利文献数据分析

- 每年申请美国专利的国家数统计
- Solution

1. Map中用<year, country>作为key输出，Emit(<year, country>,1)

   (<1963, BE>, 1), (<1963, US>, 1), (<1963, US>, 1), …

2. 实现一个定制的Partitioner，保证同一年份的数据划分到同一个Reduce节点
3. Reduce中对每一个(<year, country>, [1,1,1,…])输入，忽略后部的出现次数，仅考虑key部分：<year, country>，然后在Reduce的输出中统计每个year下的国家数

专利文献数据分析

- 更多的专利文献数据分析问题
  - 如何统计一个国家占全球的专利申请比例?
  - 如何统计一个国家的专利引用率?
  - ……

MapReduce算法设计小结

- A few design tricks ("Design Patterns")
  - Local aggregation
    - use combiner
  - Complex structures
    - such as "pairs" and "stripes"
  - value-to-key conversion
